Part two: A) Read the following passage then choose the best answer to the questions below: (2) points each.2

**Gravity** is the attraction between two objects. Every object on Earth is attracted toward the center of Earth.

Gravity is what keeps us on the ground. Without **it**, we would **drift** into space. The force between Earth and you is greater than the force between the moon and you. You would weigh less on the moon, because the moon has less mass than Earth has. The moon is attracted toward Earth. The force that exists between Earth and the moon is gravitational attraction. This force keeps the moon orbiting Earth. The moon revolves around Earth. Isaac Newton was the first person to explain the effect of gravity upon our universe. He used mathematical formula to prove that gravity is what keeps the planets in orbit. Since Newton's discoveries, we have learned a great deal about the effects of gravity. We know that, because of gravity, the moon orbits Earth. And also because of gravity, Earth revolves around the sun. gravity affects all the planets in the solar system as well as the sun.
