The Italian Scientist Galileo Galilei was born in 1564 near Pisa, Italy. He began to study medicine at the University of Pisa, was a natural philosopher, astronomer and mathematician who made fundamental contributions to the sciences of motion and astronomy. One of Galileo's most important discoveries was gravity, the force that makes things fall down. Before Galileo, there were no scientific studies of gravity. People believed that heavy objects fell faster than light objects. Galileo showed that this is not true. In his most famous experiment, he used two metal balls of different masses and dropped them from the Leaning Tower of Pisa at the same time so that they rolled down aboard. The **heavy** ball didn't roll faster than the **light** one. In this experiment, Galileo discovered the law of falling objects which is an important law of physics. In 1609, Galileo made his first telescope modeled after telescopes produced in other parts of Europe that could **magnify** objects three times. He created a telescope later that same year **which** could magnify objects twenty times. Galileo died in 1642.
